DETAILED ACTION

Allowable Subject Matter

1. Claims 2-12 are allowed.

Roberts disclose the construction of electromagnetic induction devices with multi-form winding and reflected magnetizing impedance comprising:

a cylindrical stator;

a rotor axially rotatable positioned in the center of said stator;

rotor windings integral to said rotor;

a three-phase energy winding integral to said stator and magnetically coupled to said rotor windings;

a first three-phase auxiliary winding integral to said stator and magnetically coupled to said rotor windings and electrically isolated from said energy winding, said three-phase auxiliary winding comprising three branch windings electrically coupled forming three-phase electrical terminals; and

a first capacitor electrically coupled across each of said three-phase electrical terminals.

Wanlass teach the construction of a poly-phase electric motor having controlled magnetic flux density, and comprising:

a second capacitor coupled with a first branch switch across a portion of a first one of said three branch windings;

a third capacitor is coupled with a second branch switch across a portion of a second one of said three branch windings;

a fourth capacitor is coupled with a third branch switch across a portion of a third one of said three branch windings;

said branch switches being electronic switches operable to conduct alternating current when gated on; and

a control circuit for gating said first, second, and third branch switch in response to parameters of a first voltage corresponding to a first selected branch winding and parameters of a voltage and a current corresponding to said energy winding; for the purpose of providing a motor that can be operated at a maximum flux density under most conditions of line voltage without resulting in extremely high input current for high input voltages.

2. The following is an examiner's statement of reasons for allowance.

The prior art of record, taken alone or in combination, fails to teach the construction of a rotary induction machine as claimed on independent claim 12, comprising:

a second three-phase auxiliary winding integral to said stator and magnetically coupled to said rotor windings and electrically isolated from said energy winding, said second three-phase auxiliary winding electrically isolated from and magnetically coupled to said first auxiliary winding, said second auxiliary winding comprising three branch windings electrically coupled forming three-phase electrical terminals;

a fifth capacitor electrically coupled across each of said three-phase electrical terminals of said second auxiliary winding; and

a sixth capacitor coupled with a fourth branch switch across a portion of a first one of said three branch windings of said second auxiliary winding.
